Knowledge graphs take the stage at KMWorld 2019

Knowledge graphs are having their time in the spotlight and at KMWorld 2019 many speakers stressed how the solution can transform information within companies.

Jans Aasman, CEO, Franz Inc. — AllegroGraph, said 2018 was the rise of the knowledge graphs and since then there have been many interesting ways to use it.

"Most knowledge graphs in the enterprise are 360 views on customers," Aasman said. "To really understand your customer you need to listen to what they say."

An example of recent applications of knowledge graphs is the Noam Chomsky Knowledge Graph which incorporates hundreds of articles and numerous books that Chomsky has authored about linguistics, mass media, politics, and war.

According to Aasman, a combination of AI techniques and knowledge graphs can be used to transform text-heavy applications into an interactive response system that can be used by scientists, technologists, politicians, and scholars along with smart applications, intelligent chatbots, and question/answering machines, as well as other AI, and data systems.
